

## (In)Security of e-voting

Pascal Lafourcade

Surrey, August 2023

# E-voting a reality

The screenshot shows the top of the Le Monde website. At the top center is the logo "Le Monde". To the left is a small icon of a newspaper and the text "Consulter le journal". To the right are links for "Se connecter" and "S'abonner". Below the logo is a navigation bar with categories: ACTUALITÉS, PRÉSIDENTIELLE 2022, ÉCONOMIE, VIDÉOS, DÉBATS, CULTURE, M LE MAG, SERVICES, and a search icon. The main content area features the article title "Elections régionales 2021 : le vote électronique, remède à l'abstention ?" under the sub-header "LES DÉCODEURS - RÉGIONALES & DÉPARTEMENTALES". Below the title is a summary: "Après un premier tour marqué par une abstention historique, des membres de la majorité ont appelé à moderniser les scrutins, pour voter plus facilement, et donc de mobiliser davantage les électeurs." The authors are listed as "Par Assma Maad et Clément Perruche" and the publication date is "Publié le 25 juin 2021 à 18h40 - Mis à jour le 26 juin 2021 à 10h42 - Lecture 7 min." There are also social media sharing icons for Facebook, Twitter, and others.

## Hauts-De-Seine : Neuilly-Sur-Seine Met En Place Un Système De Vote Électronique

On **Juil 5, 2021**

### Le vote électronique fera son retour en 2022

Après la découverte de failles en 2019, tous les projets de scrutin en ligne ont été suspendus. La Poste a cependant poursuivi l'aventure. Elle développe à Neuchâtel un système mieux sécurisé qu'elle soumettra à des hackers

## Flaw in NSW's iVote platform confirmed by researcher

By Rohan Pearce

Editor, Computerworld | NOV 14, 2019 6:08 AM PST

A security researcher has confirmed that the version of New South Wales' online voting platform, iVote, employed during the 2019 election contained a vulnerability that potentially allowed the creation of false decryption proofs for ballots.

Vanessa Teague, an associate professor at the University of Melbourne, has released a paper outlining the iVote flaw, building on previous work of

# Designing Secure Schemes is Difficult!

How can we be convinced that a protocol is a good one?

## Designing Secure Schemes is Difficult!

How can we be convinced that a protocol is a good one?

Publish the protocol and wait until someone finds an attack.

## Designing Secure Schemes is Difficult!

How can we be convinced that a protocol is a good one?

Publish the protocol and wait until someone finds an attack.

Prove that there is no attack.

## Designing Secure Schemes is Difficult!

How can we be convinced that a protocol is a good one?

Publish the protocol and wait until someone finds an attack.

Prove that there is no attack.

Usual problems with proofs:

- ▶ proving is a difficult task,
- ▶ pencil-and-paper proofs are error-prone.

How can we be convinced that a proof is a good one?

Cryptographic Flaw

Clash

Machine Bugs

Blockchain and vote

Conclusion

# E-Voting vs Traditional Voting

Vote électronique

Vote traditionnel

- + Accessibility
- + Reducing the abstention rate
- + Automatic counting
- + Less organisation costs

# Two e-voting (1/2)

## Offline

- + Efficient and fast counting
- + Vote in any voting station
- Trust the machines

# Two e-voting (2/2)

## Online

- + Vote at home
- + Easy process
- + Less costs
  - Possible influence

# Voting Protocol Organisation

## 5 Phases

1. Registration
2. Validation
3. Vote
4. Counting
5. Verification

**Register  
to VOTE**

# Security Requirements

Eligibility

Fairness

Universal Verifiability

Individual Verifiability

## Secure e-voting protocol

Correctness

Coercion-Resistance

Privacy

Robustness

Receipt-Freeness

## Eligibility

Only the registered voters can vote

Prevent double voting

# Robustness

Tolerate a certain number of misbehaving voters

## Correctness

Results should be correct

# Fairness

No preliminary results

## Individual Verifiability

Each voter can check whether his vote was counted correctly

## Universal Verifiability

Anybody can verify that the announced result corresponds to the sum of all votes

# Anonymity

Privacy: unlinkability between the voter and his vote

Receipt-Freeness: A voter cannot construct a receipt

Corecion-Resistance: A coercer cannot be sure the voter followed his instructions

# Privacy implies Individual Verifiability

2018 Cortier et al.

A system without Individual Verifiability cannot achieve privacy !

# Dispute Resolution in Voting

In 2020, by David Basin, Sasa Radomirovic, Lara Schmid

## Reduction Results: How many agents ?

- ▶ Security properties: **two** agents are sufficient.  
2004 by Hubert Comon-Lundh, Véronique Cortier
- ▶ When Are **Three Voters** Enough for Privacy Properties?  
2016 by Myrto Arapinis, Véronique Cortier, Steve Kremer

With 12 candidates,  $> 479$  millions possible combinations!

> 2,000,000 votes have been cast

<https://vote.heliosvoting.org/>

Helios code is Open Source  
Based on scientific papers  
Use mixnet

By V. Cortier et al in 2010

## Replaying a voter's ballot

- ▶ Alice votes A
- ▶ Bob votes B
- ▶ Charlie votes like Alice

This attack works on other protocols like Lee et al and Sako et al.

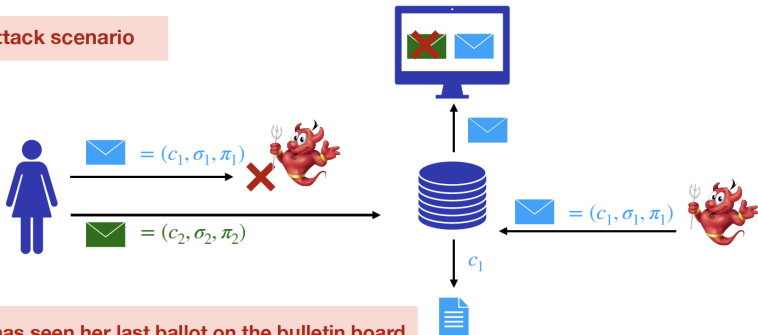

<https://www.belenios.org/>  
Belenios code is Open Source

# Re-ordering Attack on Belenios 2021

**Individual verifiability** : if I see my last ballot on the bulletin board, it will be counted.

Attack scenario

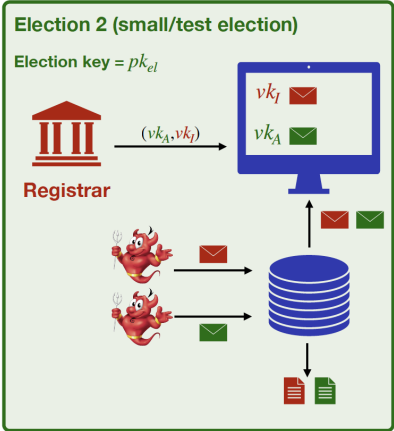

Alice has seen her last ballot on the bulletin board but this is not the one that will be counted...

Attack by Baloglu et al. CSF2021

Fix with counter + Pok by Debant et al. 2022

# Multi-server Attack on Belenios < 1.13

## A privacy attack against Belenios

# Swiss Post Attack (Bug Bounty 40Keuros)

## A privacy attack against Swiss-Post protocol

Overview of the protocol :

Cortier et al. RWC'22

# Bulletin Board

- ▶ Fifty Shades of Ballot Privacy: Privacy against a Malicious Board, by Véronique Cortier, Joseph Lallemand, Bogdan Warinschi in 2020
- ▶ Fixing the Achilles Heel of E-Voting: The Bulletin Board by, Lucca Hirshi, Lara Schmid, David Basin in 2021

# Russian Online Election

In 2019, Breaking the encryption scheme of the Moscow Internet voting system by P. Gaudry et al

- ▶ Elgamal key sizes are too small (CADO-NFS)
- ▶ Counting the number of votes cast for a candidate.

## 1994 Benaloh's Scheme

$$enc(a, pk_S) * enc(b, pk_S) = enc(a + b, pk_S)$$

Partial homomorphisms are widely used in voting schemes

$$\prod enc(v_i, pk_S) = enc(\sum v_i, pk_S)$$

## Original Benaloh's scheme is ambiguous

$$\text{dec}(\text{enc}(14, pk_S), sk_S) = 14 \pmod{15} \text{ or } 14 \pmod{5} = 4$$

### Revisited Benaloh's encryption [FLA'11]

- ▶ Drawing false parameters: 33%
- ▶ Proposition of corrected version
- ▶ Proof using Kristian Gjøsteen result.

# Impact

Example with 15 voters

$\{0\}_{pk_S}$

$\{1\}_{pk_S}$

- ▶  $\prod enc(v_i, pk_S) = enc(\sum v_i, pk_S) = enc(14, pk_S)$
- ▶ Result can be either 14 or 4

# Clash Attack on the verifiability of e-voting systems

By 2012 Kuesters et al.

Different voters with the same receipt

⇒ Authorities can manipulate the election without being detected

# Attacks

- ▶ In 2007, Security Analysis of the Diebold AccuVote-TS Voting Machine by A. Feldman et al.
- ▶ In 2012, Attacking the Washington, D.C. Internet Voting System, by Scott Wolchok et al.
- ▶ In 2017 Voting Machine Hacking Village by Matt Blaze et al.

- ▶ AVS WinVote DRE
- ▶ Premier AccuVote TSx DRE
- ▶ ES&S iVotronic DRE
- ▶ PEB version 1.7c-PEB-S
- ▶ Sequoia AVC Edge DRE
- ▶ Diebold Express Poll 5000 electronic pollbook

With limited resources and information, they can be hacked.
